I use short videos to teach online introductory statistics to non-majors. The videos focus on explaining a difficult concept, applying a particular formula or using technology to solve a homework problem. The choice of topics or problems are based on questions frequently asked by students. I find the software Jing particularly easy and quick to use in creating and sharing videos. I will share specific examples of how these videos were useful for online statistics students in learning to apply the formulas for computing standard deviation or binomial probability.
